

# Edgewood Middle School Boiler Replacement

Project Location:    Wooster, Ohio

Project Date:        2004

## Project Description:

An aging boiler plant consisting of two steel flex tube boilers was replaced with a pair of new 1400 MBH modular high efficiency condensing type boilers.

The total boiler plant was upgraded as part of the replacement including new pumps, air separator, expansion tank, chemical shot feeder fill valve etc...

The new modular boilers with a smaller physical footprint allowed for a re-arrangement of the equipment within the room to improve accessibility for service of the new equipment as well as other existing equipment within the room.

This is the fourth boiler plant upgrade and replacement designed by HEI for the school district to date.
